

To hold down your feed costs —

Raise the yield and quality of your hay and pasture!

Livestock producer Mike Johnson, Surry County, NC, (above) grew 4 tons of orchard-grass and fescue for his first cutting in 2009.

"SoySoap makes fertilizer work better," he says. When he sprayed part of his pearl millet summer pasture with SoySoap, he saw that "My cattle grazed first where I'd sprayed. They didn't move to the unsprayed millet until they'd grazed down what I'd treated. It must have tasted sweeter."

At the SunBelt Ag Expo field day July 7 at Moultrie, GA, visitors could easily see greener, more lush growth in a Coastal bermuda field plot which Expo Farm Manager Michael Williams had sprayed four weeks earlier with SoySoap.

"Forage height was the same as the adjoining Coastal, but leaves in the treated plot were broader and darker green," observed Williams.

A producer in Teton County, MT raised the Relative Feed Value of his first-cutting alfalfa from 102 to 153 — Prime grade! He sprayed 9 ounces per acre of SoySoap May 20, 2009, when alfalfa reached 4 inches. Total Digestible Nutrients rose to 65.8%. Crude Protein almost doubled over the untreated control, to 22.5% (dry matter basis) compared with 12.1% for untreated alfalfa (chart above). Baled hay yield from the treated 60-acre half of the 120-acre pivot-irrigated field rose by 1,480 lbs. per acre above the untreated 60 acres. The full analysis by Midwest Labs is available at your request.

Other ranchers and farmers have found that when they can achieve maximum nutrient flow, deep rooting and optimum health in alfalfa, they see solid stems (photo above) and consistently higher yields.

BioBased USA reserves the name *SoySoap* for its family of biobased, non-toxic "nano-technology" formulations to enhance plant growth and clean up our environment. Authorized distributors private-label each BioBased USA product under registration requirements of their state or country. BioBased USA does not sell directly to growers or consumers.
